

**Nous allons faire notre premier
vrai programme d'éléments finis
avec des triangles !**

... et avec des quadrilatères.

Même si gmsh a un peu de difficultés
à me créer de jolis maillages composés
uniquement de quads !

Typical Elliptic Boundary Value Problem

Trouver $u(\mathbf{x}) \in \mathcal{U}_s$ tel que

$$\nabla \cdot (a \nabla u) + f = 0, \quad \forall \mathbf{x} \in \Omega,$$

$$\mathbf{n} \cdot (a \nabla u) = g, \quad \forall \mathbf{x} \in \Gamma_N,$$

$$u = t, \quad \forall \mathbf{x} \in \Gamma_D,$$

En général, la fonction $\mathbf{n}$ n'est pas connue...

Mais, c'est la solution d'une équation aux dérivées partielles !

Commençons par une équation de Poisson

Construction du système linéaire discret

$$J(u^h) = \frac{1}{2} \int_{\Omega} (\nabla u^h) \cdot (\nabla u^h) d\Omega - \int_{\Omega} f u^h d\Omega,$$

$$J(u^h) = \frac{1}{2} \int_{\Omega} \left(\sum_{i=1}^n U_i \nabla \tau_i \right) \cdot \left(\sum_{j=1}^n U_j \nabla \tau_j \right) d\Omega - \int_{\Omega} f \left(\sum_{i=1}^n U_i \tau_i \right) d\Omega,$$

$$J(u^h) = \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n U_i U_j \boxed{\int_{\Omega} (\nabla \tau_i) \cdot (\nabla \tau_j) d\Omega} - \sum_{i=1}^n U_i \boxed{\int_{\Omega} f \tau_i d\Omega},$$

$$J(u^h) = \frac{1}{2} \sum_{i=1}^n \sum_{j=1}^n U_i U_j \boxed{A_{ij}} - \sum_{i=1}^n U_i \boxed{B_i},$$

$$0 = \frac{\partial J(u^h)}{\partial U_i} = \sum_{j=1}^n \boxed{A_{ij}} U_j - \boxed{B_i}, \quad i = 1, n.$$

Les éléments triangulaires, c'est bien :-)
Mais, ici des éléments quadrilatères, ce serait mieux !

Et on fait
comment
pour des
quadrilatères ?

$$A_{ij} = \int_{\Omega} (\nabla \tau_i) \cdot (\nabla \tau_j) d\Omega,$$

$$B_i = \int_{\Omega} f \tau_i d\Omega.$$

Diagram illustrating the mapping from a square element in the $\xi\eta$ plane to a quadrilateral element in the $x\eta$ plane.

The square element in the $\xi\eta$ plane has side lengths $d\xi$ and $d\eta$, and area $d\hat{\Omega} = d\xi d\eta$. The quadrilateral element in the $x\eta$ plane is labeled Ω_e .

The Jacobian determinant J_e is defined as:

$$J_e = \left| \frac{\partial x}{\partial \xi} \frac{\partial \eta}{\partial \xi} \right| = \left| \frac{\partial x}{\partial \xi} \times \frac{\partial x}{\partial \eta} \right| \underbrace{d\xi d\eta}_{d\hat{\Omega}}$$

The Jacobian determinant can also be expressed as:

$$J_e = \left| \begin{bmatrix} \frac{\partial x}{\partial \xi} & \frac{\partial x}{\partial \eta} \\ \frac{\partial y}{\partial \xi} & \frac{\partial y}{\partial \eta} \end{bmatrix} \right|_{xy}$$

The Jacobian determinant is also given by the determinant of the matrix of partial derivatives of the shape functions ϕ_i^e with respect to the natural coordinates ξ and η :

$$J_e = \begin{vmatrix} \sum \underline{X}_i^e \frac{\partial \phi_i^e}{\partial \xi} & \sum \underline{X}_i^e \frac{\partial \phi_i^e}{\partial \eta} \end{vmatrix}$$

$$x(\xi) = \sum x_i^e \phi_i(\xi)$$

$$dx(\xi) = \sum x_i^e \underbrace{\frac{\partial \phi_i(\xi)}{\partial \xi}}_{\frac{\partial x}{\partial \xi}} \cdot d\xi$$

$$J_e = \left| \det \left(\frac{\partial x}{\partial \xi} \right) \right|$$

Et zou
On est prêt !

**Calculer la solution du problème de Poisson avec des triangles linéaires ou des quads bilinéaires... Le jacobien n'est pas toujours constant !
Une code unique pour les deux cas !**

Le code est très très lent...

Ne pas essayer des maillages trop fins !

Utiliser un solveur plein n'est pas très judicieux...

On fera appel à des solveurs creux ou itératifs : on en reparlera :-)
